# BACK OF THE ENVELOPE

11/23/12  $x_L = x_B - \tau_C$  What time at 200?  $? \tau_C, x_{ab}$   $x_L = \sqrt{x_a^2 + x_b^2 - 2x_a x_b \cos \alpha}$   $\alpha + \beta + \delta = \pi$

$x_{ab} = \sqrt{x_b^2 + (\tau_b - \tau_c)^2 - 2x_b(\tau_b - \tau_c) \cos \beta}$   $\beta, \delta$  unk.  
 $\tau_c, x_{ab}$  unk.  
 $x_{ab} = \sqrt{x_a^2 + (\tau_a - \tau_c)^2 - 2x_a(\tau_a - \tau_c) \cos \delta}$   $\uparrow$  Eq. + unk.  
 $x_b^2 = x_a^2 + x_L^2 - 2x_a x_L \cos \delta$   $\triangle$  know of  $x_a, x_b, \tau_a, \tau_b$   
 $x_a^2 = x_b^2 + x_L^2 - 2x_b x_L \cos \delta$   $\triangle$   $x_L$   
 $x_L = \tau_b + \tau_a - 2\tau_c$

Solve for  $\cos \delta, \cos \beta$

$x_a^2 = x_b^2 + x_L^2 - 2x_b x_L \cos \delta \Rightarrow 2x_b x_L \cos \delta = x_b^2 + x_L^2 - x_a^2$   
 $\cos \delta = \frac{x_b^2 - x_a^2 + (x_a^2 + x_b^2 - 2x_a x_b \cos \alpha)}{2x_b x_L} = \frac{2x_b^2 - 2x_a x_b \cos \alpha}{2x_b x_L} = \frac{2x_b [x_b - x_a \cos \alpha]}{2x_b [x_L]}$

$\cos \delta = \frac{x_b - x_a \cos \alpha}{\sqrt{x_a^2 + x_b^2 - 2x_a x_b \cos \alpha}}$   $\cos \beta = \frac{x_a - x_b \cos \alpha}{\sqrt{x_a^2 + x_b^2 - 2x_a x_b \cos \alpha}}$   $\cos \delta = \frac{x_b - x_a \cos \alpha}{x_L}$   $\cos \beta = \frac{x_a - x_b \cos \alpha}{x_L}$

$x_b^2 = x_a^2 + x_L^2 - 2x_a x_L \cos \delta \Rightarrow 2x_a x_L \cos \delta = x_a^2 - x_b^2 + x_L^2 = x_a^2 - x_b^2 + x_a^2 + x_b^2 - 2x_a x_b \cos \alpha$   
 $\cos \delta = \frac{2x_a^2 - 2x_a x_b \cos \alpha}{2x_a x_L} = \frac{2x_a [x_a - x_b \cos \alpha]}{2x_a x_L} = \frac{x_a - x_b \cos \alpha}{\sqrt{x_a^2 + x_b^2 - 2x_a x_b \cos \alpha}} = \cos \delta$

$x_b^2 + (\tau_b - \tau_c)^2 - 2x_b(\tau_b - \tau_c) \cos \beta = x_a^2 + (\tau_a - \tau_c)^2 - 2x_a(\tau_a - \tau_c) \cos \delta$   $? \tau_c$

$x_L = \tau_b - \tau_c + \tau_a - \tau_c = \tau_b + \tau_a - 2\tau_c \Rightarrow 2\tau_c = \tau_b + \tau_a - x_L$   $x_L = \tau_b + \tau_a - 2\tau_c$

$\tau_c = \frac{1}{2} [\tau_b + \tau_a - x_L]$   $\tau_c = \frac{1}{2} [\tau_b + \tau_a - \sqrt{x_a^2 + x_b^2 - 2x_a x_b \cos \alpha}]$

$x_{ab} = \sqrt{x_b^2 + (\tau_b - \tau_c)^2 - 2x_b(\tau_b - \tau_c) \cos \beta} = \sqrt{x_b^2 + x_L^2 - x_b x_L \cos \beta}$

$\tau_b - \tau_c = x_L - (\tau_a - \tau_c)$   $\tau_a - \tau_c = x_b - (\tau_b - \tau_c)$

Featured in Physics

## **Astronomical random numbers for quantum foundations experiments**

Calvin Leung,<sup>1,\*</sup> Amy Brown,<sup>1,†</sup> Hien Nguyen,<sup>2,‡</sup> Andrew S. Friedman,<sup>3,§</sup> David I. Kaiser,<sup>4,¶</sup> and Jason Gallicchio<sup>1,\*\*</sup>

**Leung+2018, *Physical Review A*, Vol. 97, Issue 4, id. 042120 (arXiv:1706.02276)**

Describes an “Astronomical Random Number Generator”, built in Jason Gallicchio’s lab, used to turn cosmic photon colors into random numbers.

PHYSICAL REVIEW A **99**, 012121 (2019)

## **Relaxed Bell inequalities with arbitrary measurement dependence for each observer**

Andrew S. Friedman,<sup>1,\*</sup> Alan H. Guth,<sup>2,†</sup> Michael J. W. Hall,<sup>3,4,‡</sup> David I. Kaiser,<sup>2,§</sup> and Jason Gallicchio<sup>5,||</sup>

**Friedman+2019a, *Physical Review A*, Vol. 99, Issue 1, id. 012121 (arXiv:1809.01307)**

Derives relaxed version of Bell’s inequality without the “freedom-of-choice” assumption. Shows local realistic models that can simulate quantum theory by quantitatively reducing freedom by only a minuscule amount.

# FEYNMAN ON FREE WILL

“We have an illusion that we can do any experiment that we want. We all, however, come from the same universe, have evolved with it, and don't really have any `real' freedom. For we obey certain laws and have come from a certain past. Is it somehow that we are correlated to the experiments that we do, so that the apparent probabilities don't look like they ought to look if you assume they are random...”

– **Richard Feynman 1982**

# QUANTUM ENTANGLEMENT

Beginning in the 1930s, the great architects of quantum theory struggled to understand the notion of “entanglement.”

Niels Bohr and Albert Einstein

Erwin Schrödinger

# EPR PARADOX

A. Einstein

**E**

B. Podolsky

**P**

N. Rosen

**R**

$$|\psi\rangle = \frac{1}{\sqrt{2}} \left\{ |u_1\rangle |v_2\rangle + |u_2\rangle |v_1\rangle \right\}$$

State does not factorize: no way to describe behavior of particle 1 ( $u$ ) without referring to behavior of particle 2 ( $v$ ).

# BELL TESTS

$a, b$  : Settings

$A, B$  : Outcomes

**Big question: Are non-quantum explanations for entanglement viable?**

**If yes, QM incomplete  $\rightarrow$  Hidden variables**

# OUTLINE

**1. Entanglement Tests**

**2. Bell's Inequality vs. Bell's Theorem**

**3. Loopholes / Freedom-Of-Choice Loophole**

**4. Cosmic Bell Test with Milky Way Stars**

**5. Cosmic Bell Test with Quasars**

**6. Future Tests**

# BELL'S INEQUALITY ASSUMPTIONS

1. Realism
2. Locality
3. Freedom

[http://images.iop.org/objects/ccr/cern/54/7/19/CCfac8\\_07\\_14.jpg](http://images.iop.org/objects/ccr/cern/54/7/19/CCfac8_07_14.jpg)

John S. Bell (1928-1990)

1,2,3 → **Bell's Inequality**

Upper limits on entangled particle measurement correlations in a “**local-realist**” model

# RELAXING BELL'S ASSUMPTIONS

1. Realism
2. Locality
3. Freedom

Experiments violate Bell's inequality as predicted by quantum mechanics!

→ **At least one of 1,2,3 are false!**

But relaxing any assumption → **LOOPHOLES**  
*Alternative models could mimic quantum theory*

**e.g. Can keep realism, locality. Relax Freedom.**

Friedman, Guth, Hall, Kaiser, & Gallicchio 2019, *Phys Rev A*, 99, 1, 012121 (arXiv:1809.01307)

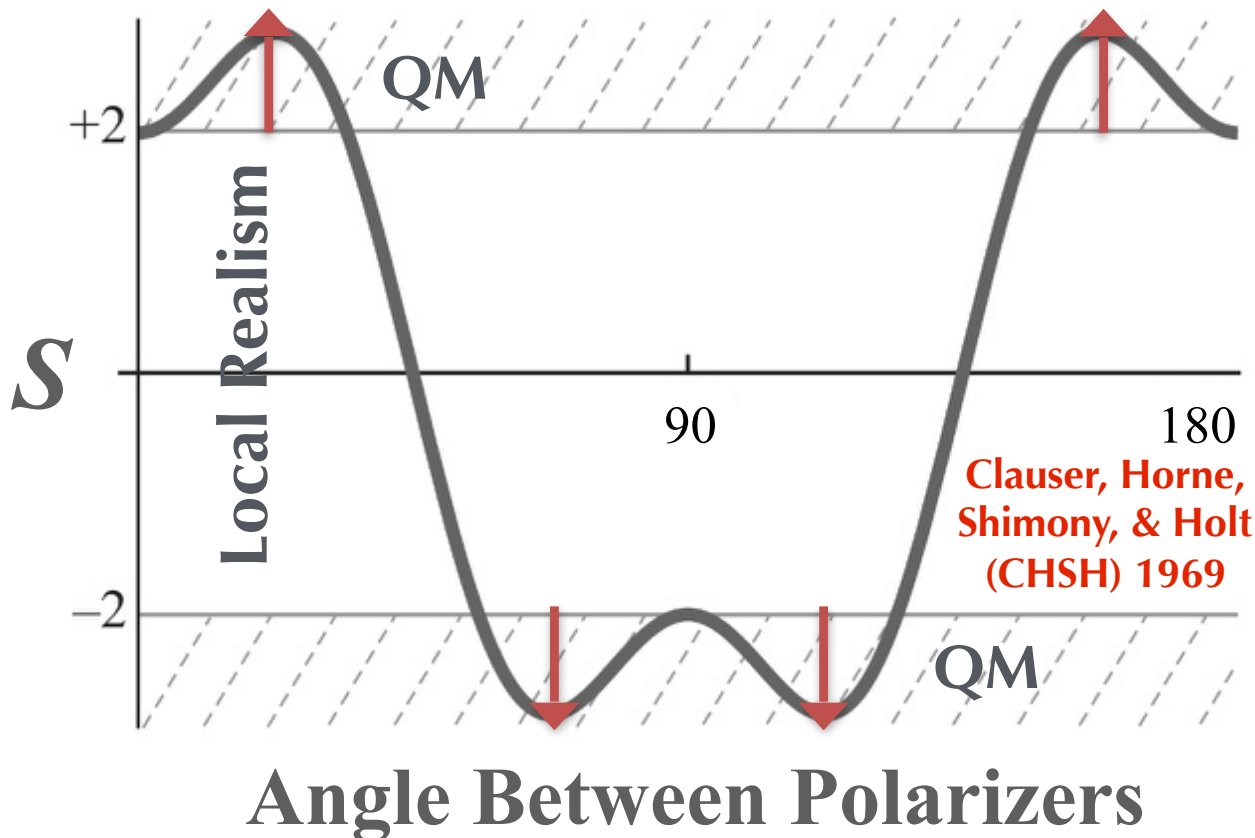

# CORRELATIONS AT A DISTANCE

correlation function:  $E(a,b) = \langle A B \rangle$

$$S = E(a, b) + E(a', b) + E(a, b') - E(a', b')$$

Bell: if  $p(A, B|a, b) = \int d\lambda p(\lambda) \underbrace{p(A|a, \lambda)} p(B|b, \lambda)$

then  $|S| \leq 2$ . Locality: A does not depend on b or B, and vice versa.)

QM prediction:  $|S_{\max}| = 2\sqrt{2}$

Dozens of experiments:  $|S_{\max}| > 2$

# BELL'S INEQUALITY

correlation function:  $E(a,b) = \langle A B \rangle$

$$S = E(a, b) + E(a', b) + E(a, b') - E(a', b')$$

Bell: if  $p(A, B|a, b) = \int d\lambda p(\lambda) \underbrace{p(A|a, \lambda)} p(B|b, \lambda)$

then  $|S| \leq 2$ . Locality: A does not depend on b or B, and vice versa.)

- **Bell's inequality:**  $|S| \leq 2$  Places limits on how correlated measurement outcomes can be in local realistic theories.
- It says nothing directly about quantum mechanics!
- Until you compare it to quantum theory as a benchmark

## BELL'S THEOREM

**No local-realist theory can reproduce the quantum predictions!**

e.g. QM prediction:  $|S_{\max}| = 2\sqrt{2}$

# OUTLINE

**1. Entanglement Tests**

**2. Bell's Inequality vs. Bell's Theorem**

**3. Loopholes / Freedom-Of-Choice Loophole**

**4. Cosmic Bell Test with Milky Way Stars**

**5. Cosmic Bell Test with Quasars**

**6. Future Tests**

# LOOPHOLES & WHY THEY MATTER

The standard interpretation of Bell tests — that “local realism” is incompatible with experiment — relies upon several assumptions.

**So What?!**

## Quantum foundations!

Understanding reality at a deep level. If universe exploits loopholes, does not mean QM is “wrong”, but perhaps derived from a more fundamental underlying theory. Quantum gravity?

## Quantum cryptography security

Tech applications! Hackers could exploit loopholes to undermine entanglement-based quantum information schemes

# LOCALITY LOOPHOLE

The standard interpretation of Bell tests — that “local realism” is incompatible with experiment — relies upon several assumptions.

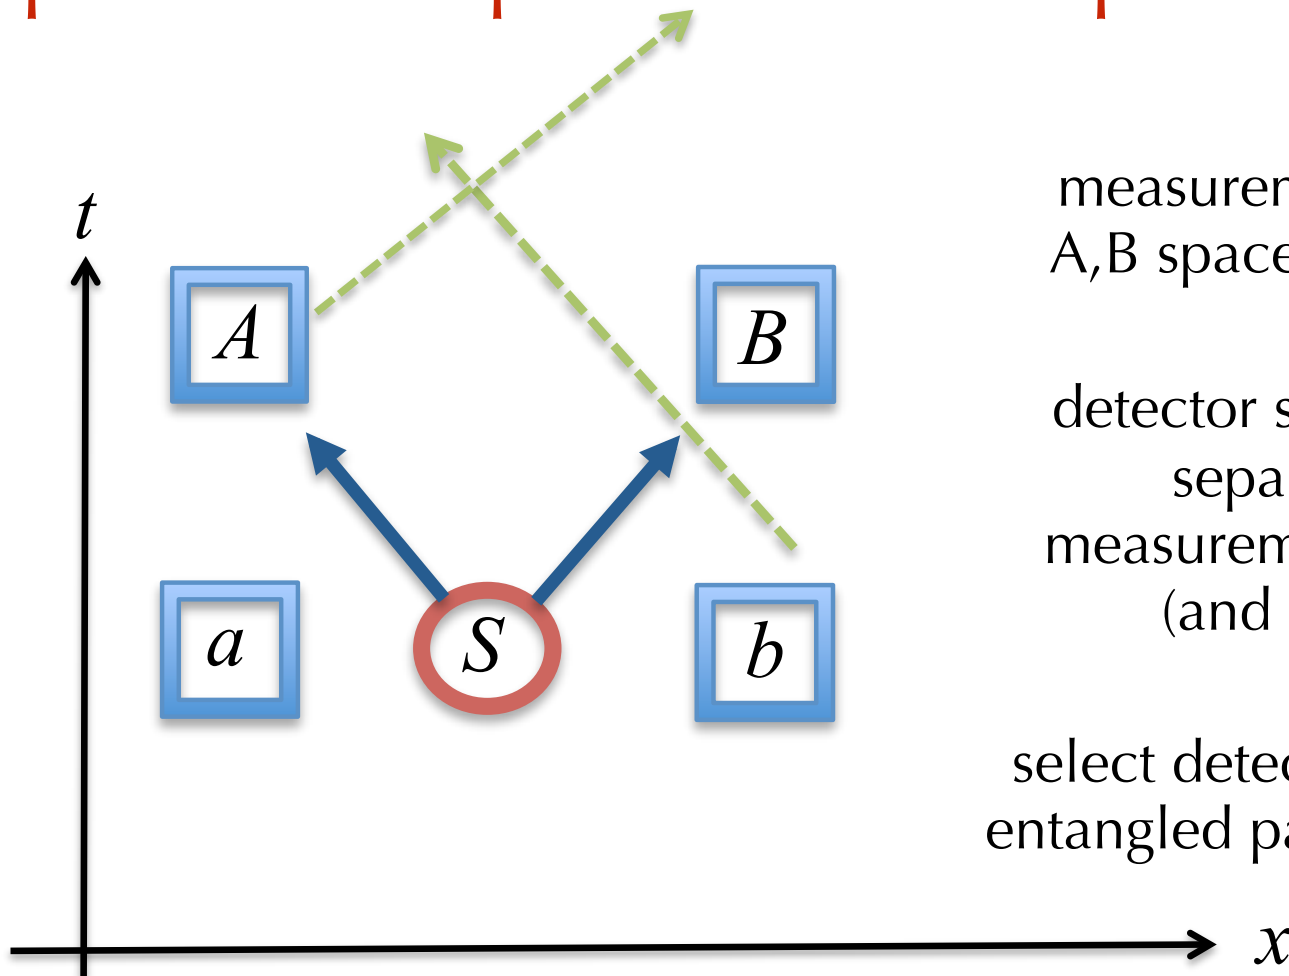

Hidden communication between parties?

# CLOSING THE LOCALITY LOOPHOLE

The standard interpretation of Bell tests — that “local realism” is incompatible with experiment — relies upon several assumptions.

Space-like separate relevant pairs of events

measurement outcomes  
 $A, B$  space like separated

detector setting choice  $a$   
separated from  
measurement outcome  $B$   
(and vice versa)

select detector settings while  
entangled particles are in flight

# DETECTION EFFICIENCY LOOPHOLE

The standard interpretation of Bell tests — that “local realism” is incompatible with experiment — relies upon several assumptions.

Also called the “fair-sampling” loophole

No detectors are 100% efficient.

What if undetected photons skewed the statistics, faking Bell violation without genuine entanglement?

**Closing loophole requires detector efficiencies  $\geq 83\%$**

Garg and Mermin, *Phys Rev D* (1987), Eberhard, *Phys Rev A* (1993)

# FREEDOM OF CHOICE LOOPHOLE

QM is most vulnerable to the “freedom-of-choice” loophole\*:  
*Are the detector settings correlated with the local hidden variable?*

$$p(A, B|a, b) = \int d\lambda \underbrace{p(A, B|a, b, \lambda)}_{\text{equivalent to}} \underbrace{p(\lambda|a, b)}_{\text{Bell explicitly assumed}}$$

$p(\lambda|a, b) = p(\lambda)$

$p(a, b|\lambda) = p(a, b)$

Bell: “It has been assumed that the settings of instruments are in some sense free variables — say at the whim of the experimenters — or in any case not determined in the overlap of the backward light cones.” (1976)

locality assumption  $p(A, B|a, b, \lambda) = p(A|a, \lambda)p(B|b, \lambda)$

\*Also known as the “measurement-independence” and “settings-independence” loophole.

# RELAXING FREEDOM OF CHOICE

If we do *not* assume  $p(\lambda|a, b) = p(\lambda)$ , then local-realist models would be compatible with the relaxed Bell inequality

$$|S| \leq 2 + M_1 + M_2 + \min\{M_1, M_2\}$$

where

$$M_1 = \max \left\{ \int d\lambda |p(\lambda|x, y) - p(\lambda|x', y)|, \int d\lambda |p(\lambda|x, y') - p(\lambda|x', y')| \right\}$$
$$M_2 = \max \left\{ \int d\lambda |p(\lambda|x, y) - p(\lambda|x, y')|, \int d\lambda |p(\lambda|x', y) - p(\lambda|x', y')| \right\}$$

Friedman, Guth, Hall, Kaiser, & Gallicchio 2019,  
*Phys Rev A*, 99, 1, 012121 (arXiv:1809.01307)

A *minuscule* amount of correlation between  $\lambda$  and  $a, b$  would suffice to mimic QM, with  $|S| \rightarrow 2\sqrt{2}$ .

**Alice and Bob only must give up ~14% experimental freedom!**

( $M_1=M_2=M \sim 0.276$ ,  $F=1-M/2 \sim 86.2\%$ ,  $M/2 \sim 13.8\%$ )

Hall 2010, *Phys Rev Lett*, 105, 250404 (arXiv:1007.5518)

Hall 2011, *Phys Rev A*, 84, 022102 (arXiv:1102.4467)

# FREEDOM OF CHOICE LOOPHOLE

$\lambda$  Hidden variables

Freedom of choice assumption

$a, b$  Joint measurement settings  $p(\lambda|a, b) = p(\lambda)$  **Eq. (1)**

**Relaxing freedom of choice:**  
*Mutual Information*

$$I = \sum_{\lambda, a, b} p(\lambda|a, b) p(a, b) \log_2 \frac{p(\lambda|a, b)}{p(\lambda)}$$

If we relax **Eq. (1)**,  
only require  
 $I=0.046 \sim 1/22$  bit of  
correlation between  
hidden variables  
and joint settings to  
simulate QM

# FREEDOM OF CHOICE LOOPHOLE

X Shrimp & Chicken Fajita	\$12.99

X Parillada Mexicana (for One)	\$13.99
<i>Pork tips, shrimp, chicken, chorizo &amp; steak.</i>	
X Parillada Mexicana (for Two)	\$22.99

If detector settings depend on hidden variables  $\lambda$  (e.g. from past events), experimental choices might not be perfectly free!

Still have free will!

But limited freedom

<http://salsasmexrestaurants.com/test/wp-content/uploads/2014/11/Fajitascombos.jpg>

# ADDRESSING FREEDOM OF CHOICE

- If we don't simply assume  $p(\lambda|a, b) = p(\lambda)$ , how might we address the “freedom-of-choice” assumption experimentally?
- Most recent experiments used QRNGs to select detector settings.
- Such devices produce output strings based on some physical process.
- *According to QM*, the outputs should be intrinsically random.

But the purported intrinsic randomness of QM is part of what is *at stake* in tests of Bell's inequality...

# TOWARD A LOOPHOLE FREE TEST

## A. Locality Loophole

*Hidden communication between parties*

**CLOSED** for photons: **Aspect+1982, Weihs+1998**

Closing Method?

Spacelike separated measurements, settings

## B. Detection Loophole

*Measured sub-sample not representative*

**CLOSED** for atoms: **Rowe+2001**, superconducting qubits:

High efficiency detectors

**Ansmann+2009**, photons: **Giustina+2013, Christensen+2013**

## 2 LOOPHOLES IN SAME TEST!

**CLOSED** Locality & Detection

**Hensen+2015 (Delft) (electrons)**

**Giustina+2015 (Vienna)**

# OBSERVED BELL VIOLATION

# SPACE-TIME DIAGRAM: STARS

# DATA ANALYSIS: NOISE LOOPHOLE

- Need triggers by genuine cosmic photons, not local “noise” photons: atmospheric airglow, thermal dark counts, errant dichroic mirror reflections
- Conservatively allow  $S=4$  for any background events,  $S<2$  for cosmic photons. Accounts for bias in red/blue ports.
- Observed sufficient signal-to-noise from cosmic sources

**Highly significant Bell violation still observed:  
Run 1: 7.31 sigma, Run 2: 11.93 sigma**

**See Handsteiner, Friedman+2017 (Supplemental Material)**

FIG. 1  
(Rauch+2018,  
Supplemental  
Material)

- Schematic cosmic Bell test space-time diagram (not to scale) in (dimensionless) conformal time  $\eta$  vs. comoving distance  $\chi$ .

- In these coords, null geodesics on  $45^\circ$  diagonals.

- On each side, quasar emits light at events  $x, y$
- Light received on Earth used to set detectors at events  $a, b$
- Meanwhile, spacelike-separated from events  $x, y$ , and  $a, b$ , source  $S$  emits entangled pairs, which are measured at events  $A, B$

# COSMIC BELL TEST (SUMMARY)

- Free space Bell test with polarization-entangled photons
- Detector settings from real-time wavelength measurements of **high-z quasar photons**, light emitted billions of years ago
- Experiment simultaneously ensures **locality**
- Assumptions: 1) fair sampling for all detected photons, 2) quasar photon wavelengths had not been selectively altered or previewed between emission and detection
- Observed statistically significant  **$9.3\sigma$  Bell inequality violation** (p-value  $\leq 7.4 \times 10^{-21}$ ) for quasar pair 1.
- **Pushes back to  $\geq 7.8$  Gyr ago most recent time when any local-realist influences could have exploited “freedom-of-choice” loophole to engineer observed Bell violation.**  
*(Previous tests  $\sim 600$  yr ago. 6 more orders of mag better!)*
- **Excludes any such mechanism from 96% of the space-time volume of our experiment’s past light cone since Big Bang.**  
*(Previous tests  $10^{-5}\%$ ). (~All vs. nothing!)*

# 2 OR MORE COSMIC SOURCES

2 (EPR) or 3 or more (GHZ) entangled particles

Greenberger, Horne, Zeilinger 1989; Greenberger+1990; Mermin 1990

Each cosmic source pair in set of  $N=2, 3$  (or  $> 3$ ) satisfies pairwise constraints from **Friedman+2013** for no shared causal past since the Big Bang at the end of

	Angular Separation	Redshift
2-Way Space	$180^\circ$	$z > 3.65$
2-Way Ground	$130^\circ$	$z > 4.13$
3-Way Space	$120^\circ$	$z > 4.37$
3-Way Ground	$105^\circ$	$z > 4.89$

**Gallicchio, Friedman, & Kaiser 2014**

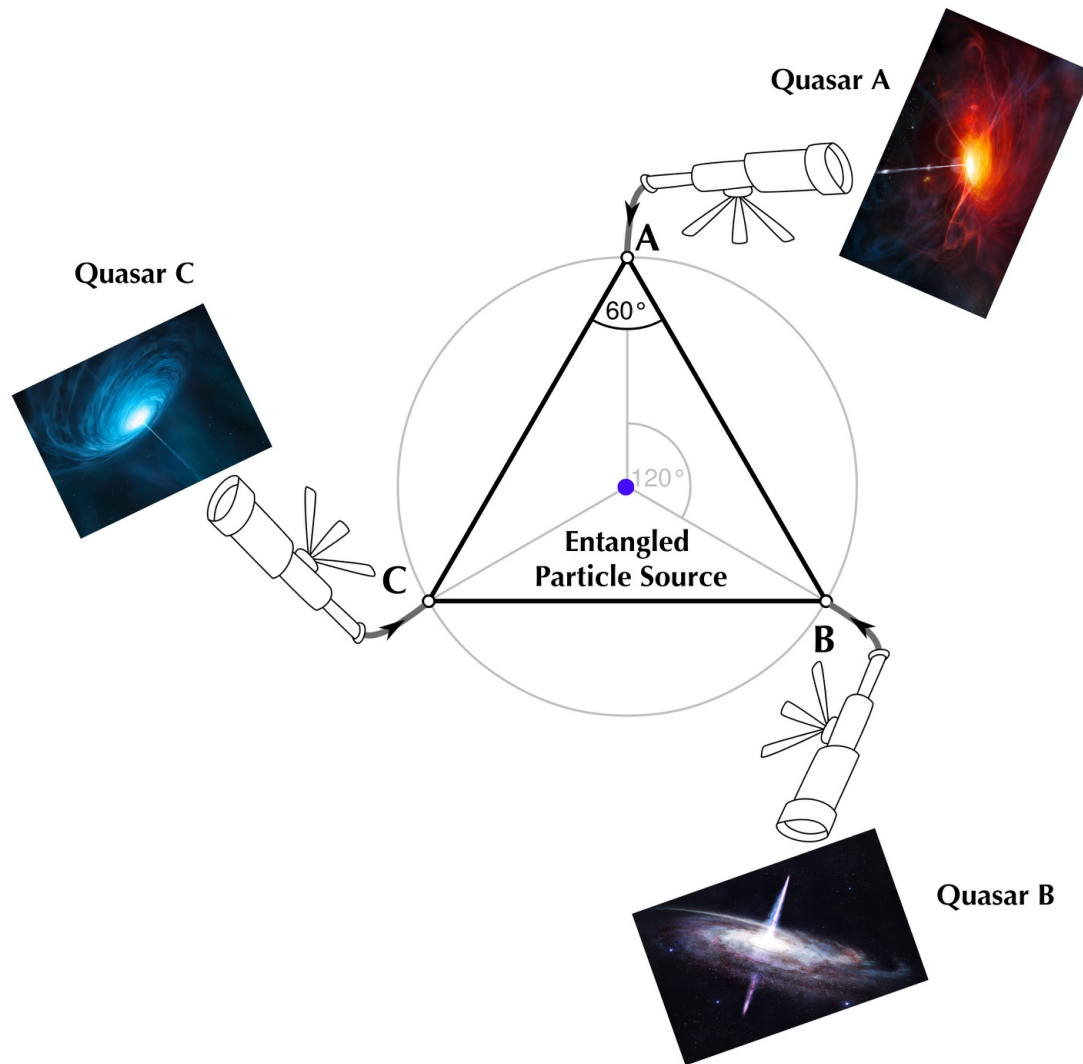

# GHZ WITH QUASARS?

3+ particles, Bell's theorem without inequalities

QM, Local realism give opposite answers to yes/no questions

Greenberger, Horne, Zeilinger 1989; Greenberger+1990; Mermin 1990

Would be difficult to remove all pairwise causal overlap.

$z > 4.37$   $120^\circ$ : space

$z > 4.89$   $105^\circ$ : ground

But GHZ pilot test with stars or brighter, moderate redshift quasars is technologically possible

# GHZ WITH CMB?

3+ particles, Bell's theorem without inequalities

QM, Local realism give opposite answers to yes/no questions

Greenberger, Horne, Zeilinger 1989; Greenberger+1990; Mermin 1990

Easy! Pick 3 CMB patches, each separated by  $2.3^\circ$

Hard! Local noise dominates from ground (**GFK14**)

Noise loophole limits better than 2-particle Bell test (**Hall 2011**)

Balloon based test in Antarctica?

# POSSIBLE OUTCOMES

Future 2-quasar/CMB Cosmic Bell tests with no causal overlap  
3 CMB patch or 3-quasar GHZ test from ground, balloon, or space

## Safe Bet

Bell or GHZ/Mermin inequalities always violated.  
Strengthen evidence for quantum theory.

**Rule out alternative theories, progressively close freedom-of-choice loophole as much as possible.**

## Longshot

Experimental results depends on which cosmic sources we look at. Maybe Bell's limit is not violated for very distant sources.

**Perhaps experimenter's lack complete freedom!**
