

\* decomposition of direct product

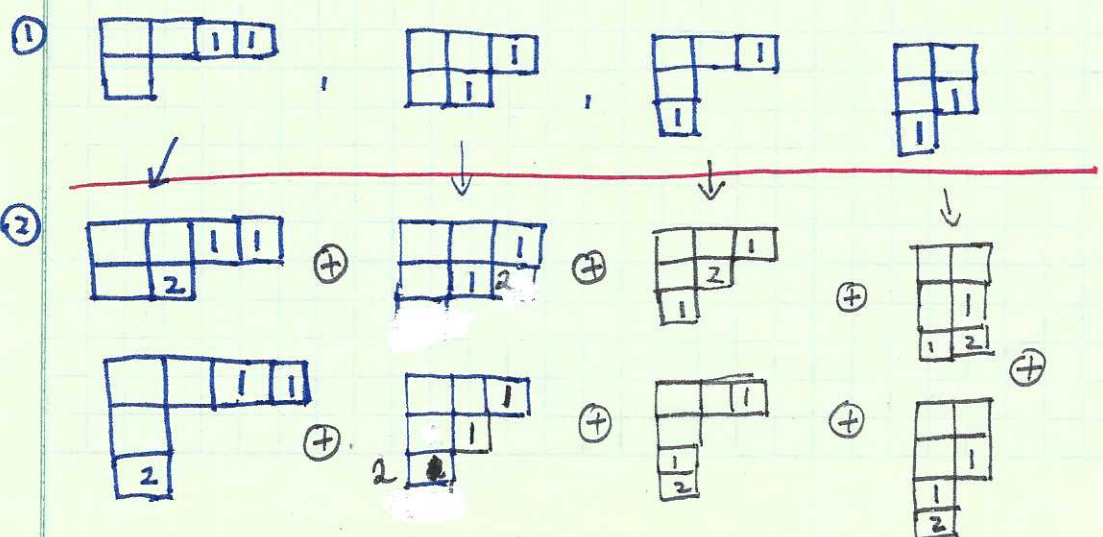

Littlewood-Richardson's rule

Consider a representation  $[\lambda] \otimes [\mu]$ . Let us take  $[\lambda]$  as the reference, and often  $[\mu]$  has less boxes. We fill  $[\mu]$  with numbers, :  $j$  or number  $j$  for all the boxes in the  $j$ -th row. Then starting from the 1st row, we move from up to the bottom to  $[\lambda]$ . It needs the boxes in  $[\mu]$  to satisfy the following requirements

- ① After finishing each row, we still have a regular Young pattern
- ② the boxes with the same # are not in the same column
- ③ From the 1st row, from right  $\rightarrow$  left, read out the new boxes row by row

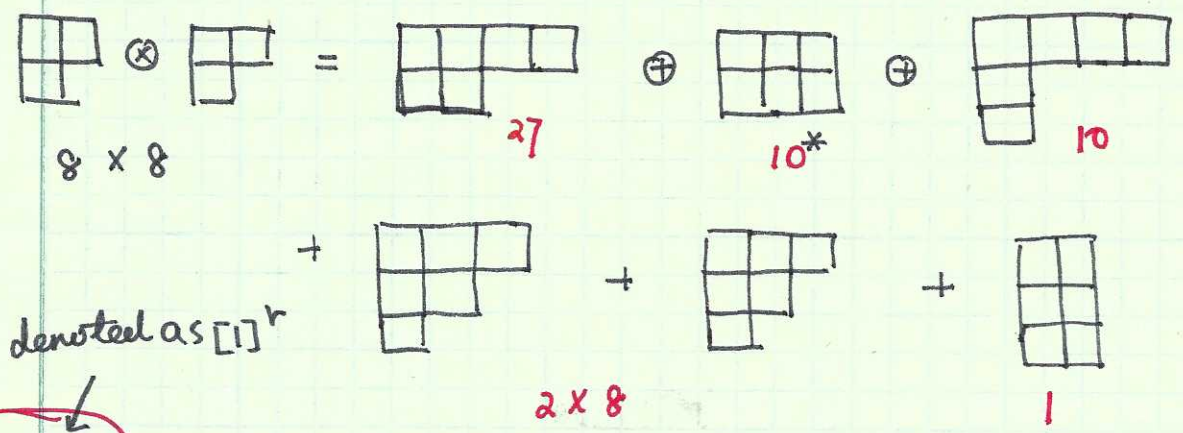

we require the # of boxes filled with large number  $\leq$  # of boxes filled with small numbers during each step.

Example.  $[21] \otimes [21]$ .

Apply the above for  $SU(3)$  group  $d(\begin{smallmatrix} \square & \square \\ \square & \square \\ \square & \square \end{smallmatrix}) = \frac{\begin{smallmatrix} 3 & 4 \\ 2 & \end{smallmatrix}}{\begin{smallmatrix} 3 & 1 \\ 1 & \end{smallmatrix}} = 8$

We should eliminate rows beyond the 3rd lines, which corresponds to 0 dimensional space. Then we have

denoted as  $[1]^r$  is an  $SU(N)$  singlet, which can be eliminated. HW: prove it

Complex conjugate representations

Hint: Consider the

direct product of  $[1]^r \otimes [\lambda] = [\lambda] \Rightarrow N \left\{ \begin{smallmatrix} \square & \square & \square \\ \square & \square & \square \\ \square & \square & \square \end{smallmatrix} \right\} \rightarrow \begin{smallmatrix} \square & \square \\ \square & \square \end{smallmatrix}$

⑧ Covariant / contravariant tensors

If  $D(G)$  is a representation of group  $G$ , then  $D(G)^*$  or  $[D(G)]^T$  is also a representation. Tensors transform according to  $(D(G))^*$  are called contravariant tensors.

$$\begin{aligned}
 O_u T^{a_1 \dots a_n} &= \sum_{b_1 \dots b_n} U_{a_1 b_1}^* \dots U_{a_n b_n}^* T^{b_1 \dots b_n} \\
 &= \sum_{b_1 \dots b_n} T^{b_1 \dots b_n} (U^\dagger)_{b_1 a_1} (U^\dagger)_{b_2 a_2} \dots (U^\dagger)_{b_n a_n}
 \end{aligned}$$

→  $(n, m)$  mixed tensor

$$O_u T_{a_1 \dots a_n}^{b_1 \dots b_m} = \sum_{a'_1 \dots a'_n} U_{a_1 a'_1} \dots U_{a_n a'_n} T_{a'_1 \dots a'_n}^{b'_1 \dots b'_m} (U^{-1})_{b'_1 b_1} \dots (U^{-1})_{b'_m b_m}$$

Contract:  $(n, m) \rightarrow (n-1, m-1)$  ← trace tensor

$$\begin{aligned}
 O_u \sum_{c=1}^N T_{c a_1 \dots a_n}^{c b_1 \dots b_m} &= \sum_{c d d'} U_{c d} U_{c d'}^* \sum_{a'_1 \dots a'_n} U_{a_1 a'_1} \dots U_{a_n a'_n}^* T_{d a'_1 \dots a'_n}^{d' b'_1 \dots b'_m} \\
 &= \sum_{(a'_1) (b'_1)} U_{a_1 a'_1} \dots U_{a_n a'_n}^* \left( \sum_d T_{d a'_1 \dots a'_n}^{d b'_1 \dots b'_m} \right)
 \end{aligned}$$

\*  $(1, 1)$  mixed tensor -  $\delta$ -function

$$O_u \delta_a^b = \sum_{a' b'} U_{a a'} U_{b' b}^* \delta_{a'}^{b'} = \sum_{a' b'} U_{a a'} \delta_{a'}^{b'} (U^{-1})_{b' b} = \delta_a^b$$

$\delta_a^b$  — decompose trace-space and traceless-space

$$T_a^b = \underbrace{\left\{ T_a^b - \frac{1}{N} \delta_a^b \sum T_c^c \right\}}_{\text{traceless space}} + \underbrace{\delta_a^b \left( \frac{1}{N} \sum T_c^c \right)}_{\text{trace}}$$

But for  $T_{ab}^d$  (2,1) rank-mixed tensor, it's more complicated <sup>(4)</sup>

define 
$$\Phi_{ab}^d = T_{ab}^d + \delta_a^d \left( \sum_{p=1}^N C_1 T_{bp}^p + C_2 T_{pb}^p \right) + \delta_b^d \left( \sum_{p=1}^N C_3 T_{ap}^p + C_4 T_{pa}^p \right)$$

according to  $\sum_a \Phi_{ab}^a = 0$  and  $\sum_b \Phi_{ab}^b = 0$ , solve

$$C_1 = C_4 = \frac{1}{N^2 - 1}, \quad C_2 = C_3 = -\frac{N}{N^2 - 1}.$$

### \* Relation between covariant and contra-variant tensor

Consider  $m$ -th rank fully antisymmetric tensor  $T^{b_1 \dots b_m}$ , i.e.  $[1^m]^*$

We define 
$$\Phi_{a_1 \dots a_{N-m}} = \frac{1}{m!} \sum_{b_1 \dots b_m} \epsilon_{a_1 \dots a_{N-m} b_1 \dots b_m} T^{b_1 \dots b_m}$$

HW: Prove that  $\Phi_{a_1 \dots a_{N-m}}$  is a  $N-m$  rank fully anti-symmetric tensor, denoted as  $[1^{N-m}]$ . Also please find the inverse of the above expression, i.e. use  $\Phi_{a_1 \dots a_{N-m}}$  to express  $T^{b_1 \dots b_m}$ .

Hence  $\Phi$  and  $T$  are two sets of bases of the same tensor subspace, hence  $[1^m]^* \cong [1^{N-m}]$ .

i.e. 
$$m \begin{array}{|c|} \hline \square \\ \hline \vdots \\ \hline \square \\ \hline \end{array}^* \cong \begin{array}{|c|} \hline \square \\ \hline \vdots \\ \hline \square \\ \hline \end{array}^{N-m}$$

We can similarly generalize

For example

to other representations.

• Decomposition of  $SU(N)$  representation to  $SU(N-1)$

Consider the problem to decompose rank- $r$  tensor space of  $SU(N)$ , i.e.  $N$ -dim complex vector space into irreducible tensors. Each  $SU(N)$  rep is denoted by a Young pattern, and an irreducible tensor subspace is by a Young operator to a Young tableau filled with numbers of 1 to  $r$ . But when we use the Young tableau to construct the tensor basis, we are filling in each box with the index of vector from 1 to  $N$ . If we remove  $N$ , we get a basis for the  $SU(N-1)$  group.

For example: For the Rep  $\gamma^{[3]}$ , fully symmetric, for  $SU(3)$ , it's 10 dim.

they are

$\begin{array}{ c c c } \hline 1 & 1 & 1 \\ \hline \end{array}$	$\begin{array}{ c c c } \hline 1 & 1 & 2 \\ \hline \end{array}$	$\begin{array}{ c c c } \hline 1 & 2 & 2 \\ \hline \end{array}$	$\begin{array}{ c c c } \hline 2 & 2 & 2 \\ \hline \end{array}$	$\begin{array}{ c c c } \hline & & \\ \hline \end{array}$	4
$\begin{array}{ c c c } \hline 1 & 2 & 3 \\ \hline \end{array}$	$\begin{array}{ c c c } \hline 1 & 2 & 3 \\ \hline \end{array}$	$\begin{array}{ c c c } \hline 2 & 2 & 3 \\ \hline \end{array}$		$\begin{array}{ c c c } \hline & & \\ \hline \end{array}$	3
$\begin{array}{ c c c } \hline 1 & 3 & 3 \\ \hline \end{array}$	$\begin{array}{ c c c } \hline 2 & 3 & 3 \\ \hline \end{array}$			$\begin{array}{ c } \hline \\ \hline \end{array}$	2
$\begin{array}{ c c c } \hline 3 & 3 & 3 \\ \hline \end{array}$				$\bullet$	1
				<hr style="width: 50px; margin-left: 0;"/>	
				$SU(2)$	10

remov 3

another example: for Rep  $\gamma^{[2,1]}$  of  $SU(3)$ , it's 8 dimensional.

The basis

$\begin{array}{ c c } \hline 1 & 1 \\ \hline 2 \\ \hline \end{array}$	$\begin{array}{ c c } \hline 1 & 2 \\ \hline 2 \\ \hline \end{array}$		$\begin{array}{ c c } \hline & \\ \hline & \\ \hline \end{array} = \begin{array}{ c } \hline \\ \hline \end{array}$	2	
$\begin{array}{ c c } \hline 1 & 1 \\ \hline 3 \\ \hline \end{array}$	$\begin{array}{ c c } \hline 1 & 2 \\ \hline 3 \\ \hline \end{array}$	$\begin{array}{ c c } \hline 2 & 2 \\ \hline 3 \\ \hline \end{array}$	$\begin{array}{ c c } \hline 1 & 3 \\ \hline 2 \\ \hline \end{array}$	$\begin{array}{ c c } \hline & \\ \hline & \\ \hline \end{array}, \begin{array}{ c c } \hline & \\ \hline & \\ \hline \end{array} = \bullet$	+3 +1
$\begin{array}{ c c } \hline 1 & 3 \\ \hline 3 \\ \hline \end{array}$	$\begin{array}{ c c } \hline 2 & 3 \\ \hline 3 \\ \hline \end{array}$		$\begin{array}{ c } \hline \\ \hline \end{array}$	+2	
				<hr style="width: 50px; margin-left: 0;"/>	8

remov 3

Basically, for a given Young pattern, ( $r$ -boxes), we fill in the indexes of vector basis to construct tensor subspace basis.

Each row can only be filled in at most one  $N$ . If an  $N$  indeed appears, we can perform vertical permutation, to move it to the end of the column. This permutation operation multiplies from the right to the Young operator, i.e. to the  $Q$  part, hence, it does not change the basis, just up to a sign.

The further first row: The only possible places for  $N$ 's are those boxes without the 2nd row below it. Then we perform row permutation below

to move them to the upmost right boxes. Since they don't belong any columns, this row permutation commutes with  $Q$  part of the Young operator, and does not change the basis.

Now we ~~can~~ move  $N$ 's to the right places: The ends of columns, and the first row from the right.

- $k+1$  possibilities
- No  $N$ ,
- one  $N$ .
- two  $N$ 's

Two possibilities: with a  $N$  or not

...  $k$   $N$ 's from right

Example: decompose the  representation of SU(3) in terms of SU(2).

Solution: The dimension of  $d(\text{Young Diagram}) = \frac{\begin{matrix} 3 & 4 & 5 & 6 \\ 2 & 3 \end{matrix}}{\begin{matrix} 5 & 4 & 2 & 1 \\ 2 & 1 \end{matrix}} = \frac{3 \cdot 4 \cdot 5 \cdot 2 \cdot 3}{5 \cdot 4 \cdot 2 \cdot 1} = 27$

→  =  3

 =  4

 =  2

 5

 =  $\cdot$  1

 =  3

 =  2

 4

 3

27

SU(2)

great!

This is a complete decomposition!

Decomposition of  $SU(M+N)$  into  $SU(N) \otimes SU(M)$ .  
a Rep of

For example, in the grand unification theory  $SU(5)$ , its fundamental spinor  $\square$  can be decomposed into a  $[\square \otimes \bullet] \oplus [\bullet \otimes \square] = (3,1) \oplus (1,3)$   
 $SU(3) \quad SU(2) \quad SU(3) \quad SU(2)$

Suppose we have an  $SU(N+M)$  representation, say.  $SU(2+3)$ 's

representation of  Let's decompose into  $SU(N) \otimes SU(M)$ .  
 $N+M=5$  with  $N=2$  and  $M=3$ .  
 $r=5$

We assume there are  $r_1$  boxes for the  $SU(N)$  and  $r_2$  boxes for  $SU(M)$  with  $r_1+r_2=5$ . Say a  $\overbrace{\square}^{r_1=3}$  for  $SU(3)$ , and  $r_2=2$   $\square$  for

$SU(2)$ . The number of the representation  $\square \otimes \square$  in the  $SU(3) \otimes SU(2)$  is the number defined in the following way.  
vector bases 1,2,3  
vector bases 4,5

representation  is the number defined in the following way.  
 $SU(3+2)$

We treat  $\square$  and  $\square$  as  $SU(5)$  Reps, and we check

the # of  appears in  $\square \otimes \square$ . This # is the number

of  $\square \otimes \square$  appearing in the decomposition of  $\square$  of  $SU(3) \otimes SU(2)$  into  $SU(5)$ .
